EX.NO:1 CREATION OF INTERACTIVE WEBSITE

Date: DESIGN USING HTML AND AUTHORING TOOLS

AIM:

The aim of this project is to create an inter active website using HTML and authoring tools.

ALGORITHM:

1. Define the purpose of the website and identify the target audience.

2. Plan the layout of the website, including the pages and navigation.

3. Choose an authoring tool, such as Dream weaver or Word Press , to create the website.

ALPHA COLLEGE OF ENGINEERING

4. Use HTML to design the pages of the website.

5. Add inter active elements, such as forms and buttons ,to engage the user.

6. Optimize the website for search engines and accessibility.

7. Test the website on different devices and browsers.

8. Publish the website to a webhosting service.

EX.NO:2 FORM VALIDATION USINGJAVASCRIPT

Date:

AIM:

The aim of form validation using JavaScript is to ensure that user- submitted data is accurate, complete, and properly formatted before it is processed by the server. This helps to prevent errors and data loss, and ensures a better user experience.

ALGORITHMS:

1. Gets the form element from the HTML document using JavaScript.

2. Add an event listener to the form element that listens for the submit event.

3. Inside the event listener function, prevent the default form submission behavior using event. Prevent Default ().

ALPHA COLLEGE OF ENGINEERING

4. Retrieve the values of the form fields using JavaScript and validate those using conditional statements.

5. If any field is invalid, display an error message and prevent the form from submitting.

6. If all fields are valid, submit the form.

Downloaded by IT PAYALUGA (itpayalaluga2k24@gmail.com)

PROGRAM:

EX.NO:3 CREATION OF SIMPLE PHP SCRIPTS

Date:

AIM:

The aim of creating simple PHP scripts is to enable web developers to build dynamic web pages that can interact with databases and provide customized responses to user input.

ALGORITHMS:

1. Identify the purpose of the PHP script: Determine what the script should accomplish, whether it's processing user input, retrieving data from a database, or generating dynamic content.

2. Set up the PHP environment: Install PHP and configure the web server to support PHP scripts.

3. Create a new PHP file: Use a text editor or integrated development environment (IDE) to create a new file with a .php extension.

4. StartwiththePHPopeningtag:BeginthePHPscriptwiththeopening<?phptag

5. Write PHP code: Write PHP code that performs the desired task, such as processing form data, querying a database, or generating HTML content.

6. Test the PHP script : Save the PHP script to a web server and test it in a web browser to verify that it's functioning correctly.

7. Debug and refine the script: If the script doesn't work as expected, use error messages and debugging tools to identify and fix any issues.

8. Add comments and documentation: Add comments to the code to explain its purpose and make it easier to maintain in the future.

9. Refactor and optimize: Refactor the code to make it more efficient and optimize it for performance.

10. Deploy the PHP script: Upload the PHP script to the web server and integrate it

EX.NO:4 HANDLING MULTIMEDIA CONTENT IN WEBSITES

Date:

AIM:

The aim of handling multimedia content in web sites is to ensure that users have a seamless and enjoyable experience while accessing multimedia content on a website.

ALGORITHMS:

1. Determine the types of multimedia content that will be used on the website, such as images, videos, audio, and animations.

2. Optimize multimedia files for the web by compressing them without sacrificing quality. This can be done using image compression tools, video compression tools, and audio compression tools.

3. Implement lazy loading for multimedia content to improve the website's loading speed. This involves only loading multimedia content when it is necessary, such as when the user scrolls to a certain point on the page.

4. Use responsive design techniques to ensure that multimedia content is displayed properly on different devices and screen sizes. This includes using responsive image and video tags, and using CSS to adjust the size and position of multimedia elements.

5. Provide an intuitive interface for users to interact with multimedia content, such as allowing them to play and pause videos, adjust the volume, and control the playback speed.

6. Ensure that multimedia content is accessible to users with disabilities, such as providing captions and transcripts for videos and audio files, and using al tags for images. Monitor website performance and user feedback to continuously optimize multimedia content for the website.

7. Monitor website performance and user feedback to continuously optimize multimedia content for the website.

EX.NO: 5 i) WRITE PROGRAMS USING SERVLETS

Date: TO INVOKE SERVLETS FROM HTMLFORMS

AIM:

The aim of invoking servlets from HTML forms is to enable the server-side processing of form data submitted by users on a web page.

ALGORITHMS:

1.Create an HTML form that will collect data from the user. The form should have action attribute set to the URL pattern of the servlets that will handle the form submission and a method attribute set to POST or GET.

2.Create a servlets that will handle the form submission. This involves extending the Http Servlet class and overriding the do Post or do Get method, depending on the method used in the form.

3.In the servlet, retrieve the form data submitted by the user using there quest oject's get Parameter method. This method takes the name of the form input element as a parameter and returns its value.

ALPHA COLLEGE OF ENGINEERING
Thirumazhisai

4.Validate the form data to ensure that it meets the required format and values. This involves checking for errors and generating appropriate error messages if necessary.

5.Process the form data to perform the necessary actions, such as updating a database, sending an email, or generating a report.

6.Generate a response to be displayed back to the user. This involves using the response object's Print Writer to write HTML code that will be displayed in the user's browser.

7.MaptheservlettoaURLpatternintheweb.xml file. This allows the servlets to be invoked when the form is submitted.

8.Deploy the web application to a server and test the HTML form by submitting data and verifying that the servlet is invoked, the data is processed correctly, and the response is displayed back to the user.

ii) Session tracking using hidden form fields and session tracking for a hit count

ALPHA COLLEGE OF ENGINEERING
Thirumazhisai

This document is available on studocu
Downloaded by IT PAYALUGA (itpayalaluga2k24@gmail.com)

AIM:

To implement session tracking in a Servlet to keep track of the number of times a user has visited a page.

ALGORITHM1:

Step1: Create a JSP or HTML page with a form that has a hidden input field. This field should be named "sessionId" and should have a value equal to the session ID.

Step2: In the Servlet, use the Http Servlet Request object to retrieve the session ID from the hidden input field. If the session ID does not exist in the hidden input field, create a new session ID and store it in the hidden input field.

Step3: Use the Http Servlet Response object to set a cookie with the session ID. Step 4: Use the Http Session object to store any session attributes you need

ALPHA COLLEGE OF ENGINEERING
Thirumazhisai

ALGORITHM2:

Step1:Create a Servlet that extends Http Servlet.

Step2: Over ride the do Get ( ) method to retrieve the current session, and then retrieve "hitCount" attribute from the session.

Step3: If the"hitCount"attributedoesnotexist,setitto1. Otherwise, increment itby1.

Step 4: Store the "hitCount" attribute in the session.

Step5: Send the "hitCount" attribute to the client in the response.

Step6: Over ride the do Post ( ) method to call the do Get( ) method.

EX.NO:6 CREATION OF INFORMATION RETREIVEL SYSTEM USING WEB, PHP, AND MYSQL

Date:

AIM:

The aim of this project is to create an information retrieval system using web technologies like PHP and MySQL.

ALGORITHM:

Step1: Design the database schema for the information retrieval system. Determine the tables, fields, and relationships between the tables.

Step2: Create a database using MySQL and populate it with sample data.

Step3: Design the user interface for the search feature. This may involve creating an HTML form where users can enter search terms and submit the form to the server.

Step4: Write PHP code to handle the user input from the search form. The PHPcode should connect to the MySQL database, retrieve the relevant data based on the user input, and display the results to the user.

Step 5: Implement a ranking algorithm to sort the search results by relevance. This may involve calculating as core based on factors like the frequency of these arch terms in the database and the proximity of the search terms to each other.

Step6: Implement pagination to display search results across multiple pages.

Step7: Add security measures to prevent SQL injection attacks and other security vulnerabilities.

Step 8: Test the system thoroughly to ensure that it works as expected.

Step9: Deploy the system to a web server and make it accessible to users.

Step10:Monitor the system for performance and security issues, and make updates as needed to improve the system over time.

This document is available on studocu

Downloaded by IT PAYALUGA (itpayalaluga2k24@gmail.com)

PROGRAM:

1.Create a MySQL database and table to store the information we want to retrieve:

```
CREATEDATABASEexample_db;

USE example_db;

CREATETABLEexample_table (
   idINT(6)UNSIGNEDAUTO_INCREMENTPRIMARYKEY, name
   VARCHAR(30) NOT NULL,
   emailVARCHAR(50)NOTNULL,
   phoneVARCHAR(20)NOTNULL
);
```

2.Create a PHPscript to connect to the database and retrieve the information:

```
<?php
//Connecttodatabase
$servername="localhost";
$username="username";
$password="password";
$dbname="example_db";

$conn=newmysqli($servername,$username,$password,$dbname);

//Checkconnection
if($conn->connect_error){
   die("Connectionfailed:".$conn->connect_error);
}

//Retrieveinformationfromdatabase
$sql="SELECT*FROMexample_table";
$result=$conn->query($sql);

//Closedatabaseconnection
$conn->close();
?>
```

EX.NO:7 CREATION OF INFORMATION RETREIVELSYSTEM USING WEB, PHP, AND MYSQL

Date:

AIM:

The aim of creating a Personal Information System (PIS) is to provide individuals with a centralized platform to manage their personal information securely And conveniently.

ALGORITHM:

1. Define the data types to be included in the PIS such as personal details(name, dateof birth, contact details, etc.), education details, work experience, financial information, medical history, etc.

2. Design the user interface for the PIS. The interface should be intuitive and user-friendly.ItshouldprovideeasynavigationandaccesstodifferentsectionsofthePIS.

3. Develop a secure login system with multi-factor authentication to protect the user's data from unauthorized access.

ALPHA COLLEGE OF ENGINEERING
Thirumazhisai

4. Create a database to store user data. The database should be secure, scalable, and easily accessible. Use encryption and hashing techniques to secure the data.

5. Implement data validation and verification methods to ensure the accuracy and integrity of the data entered by the user.

6. Create an analytics engine to generate insights and reports based on the user's data. This engine can provide valuable information on the user's spending habits, health status, career progress, etc.

7. Enable data sharing with trusted third-party services if required. The user should have full control over what data is shared and with whom.

8. Providedatabackupandrecoverymechanismstoensurethattheuser'sdatais not lost in case of hardware failure or other unforeseen events.

9. TestthePISthoroughlytoensurethatitmeetstherequirementsandspecifications.

10. Rollout the PIS and provide ongoing support and maintenance to ensure its smooth operation.
